Tech commentaries:

The **Celsius / US Dollar** cryptocurrency price gained **70.32%** on the last trading day (Sunday, 5th May 2024), rising from **\$0.285** to **\$0.485**. During the last trading day the cryptocurrency fluctuated **64.81%** from a day low at **\$0.301** to a day high of **\$0.497**. The price has been going up and down for this period, and there has been a 198.24% gain for the last 2 weeks. Volume has increased on the last day along with the price, which is a positive technical sign, and, in total, **43 million** more shares were traded than the day before. In total, **52 million** shares were bought and sold for approximately **\$25.18** million.

The cryptocurrency has broken the very wide and falling short-term trend up. Firstly a slower falling rate is indicated, but this may very well be an early signal of a trend shift. On the reaction, there will be support on the roof of the current trend broken, which is **\$0.372**, a level that may pose a second chance to hit a runner. According to fan-theory **\$0.613** will be the next possible trend-top level and thereby pose a resistance level that may not be broken at the first attempt.

The **Celsius / US Dollar** cryptocurrency holds buy signals from both short and long-term Moving Averages giving a positive forecast for the stock. Also, there is a general buy signal from the relation between the two signals where the short-term average is above the long-term average. On corrections down, there will be some support from the lines at **\$0.252** and **\$0.201**. A breakdown below any of these levels will issue sell signals. A buy signal was issued from a pivot bottom point on **Tuesday, April 30, 2024**, and so far it has risen 268.16%. Further rise is indicated until a new top pivot has been found. Furthermore, there is a buy signal from the 3 month Moving Average Convergence Divergence (MACD). Volume is rising along with the price. This is considered to be a good technical signal.

On the downside, the cryptocurrency finds support just below today's level from accumulated volume at \$0.376. There is no resistance from accumulated volume above today's level and given the right condition the cryptocurrency may perform very well during the next couple of days.

This cryptocurrency may move very much during the day (volatility) and with a very large prediction interval from the Bollinger Band this cryptocurrency is considered to be "very high risk". During the last day, the cryptocurrency moved **\$0.195** between high and low, or **64.81%**. For the last week, the cryptocurrency has had daily average volatility of **64.10%**.

Celsius / US Dollar holds several positive signals, but we still don't find these to be enough for a buy candidate. At the current level, it should be considered as a hold candidate (hold or accumulate) in this position whilst awaiting further development. Due to some small weaknesses in the technical picture we have downgraded our analysis conclusion for this cryptocurrency since the last evaluation from a Buy to a Hold/Accumulate candidate.

Risk: Very High

Evaluation: Hold/Accumulate
