Tech commentaries:

The **Georgia Power Co Series 2017A 5.00%** ETF price gained **0.203%** on the last trading day (Thursday, 28th Mar 2024), rising from **$24.59** to **$24.64**. During the last trading day the ETF fluctuated **0.94%** from a day low at **$24.55** to a day high of **$24.78**. The price has been going up and down for this period, and there has been a 0.2% gain for the last 2 weeks. Volume has increased on the last day along with the price, which is a positive technical sign, and, in total, **33 thousand** more shares were traded than the day before. In total, **42** thousand shares were bought and sold for approximately **$1.04** million.

The ETF lies in the lower part of a narrow and strong rising trend in the short term, and this may normally pose a very good buying opportunity. If the lower trend floor at $24.58 is broken, it will firstly indicate a slower rate of rising, but may also be an early warning for a trend shift. Given the current short-term trend, the ETF is expected to rise **11.22%** during the next 3 months and, with a 90% probability hold a price between **$27.34** and **$27.83** at the end of this 3-month period.

The **Georgia Power Co Series 2017A 5.00%** ETF holds a sell signal from the short-term Moving Average; at the same time, however, there is a buy signal from the long-term average. Since the short-term average is above the long-term average there is a general buy signal in the ETF giving a positive forecast for the stock. On further gains, the ETF will meet resistance from the short-term Moving Average at approximately **$24.79**. On a fall, the ETF will find some support from the long-term average at approximately **$24.24**. A break-up through the short-term average will send a buy signal, whereas a breakdown through the long-term average will send a sell signal. **Georgia Power Co Series 2017A 5.00%** has increased volume and follows the last lift in the price. This is considered to be a technical positive sign as volume should follow the price-formation. Higher liquidity also reduces the general risk. Some negative signals were issued as well, and these may have some influence on the near short-term development. A sell signal was issued from a pivot top point on **Tuesday, March 26, 2024**, and so far it has fallen -1.20%. Further fall is indicated until a new bottom pivot has been found. Furthermore, there is currently a sell signal from the 3 month Moving Average Convergence Divergence (MACD).

On the downside, the ETF finds support just below today's level from accumulated volume at **$22.54** and **$22.23**. On the upside the ETF meets some resistance just above today's level from accumulated volume at **$24.71**, **$24.74** and **$24.94**.

In general the ETF tends to have very controlled movements and with good liquidity the risk is considered very low in this stock. During the last day, the ETF moved **$0.230** between high and low, or **0.94%**. For the last week the ETF has had daily average volatility of **1.02%**.

Several short-term signals, along with a general good trend, are positive and we conclude that the current level may hold a buying opportunity as there is a fair chance for **Georgia Power Co Series 2017A 5.00%** ETF to perform well in the short-term.

Risk: Low

Evaluation: Buy Candidate
