Tech commentaries:

The **Ishares Msci Brazil Ucits Etf Usd (dist)** ETF price fell by **-1.17%** on the last day (Tuesday, 25th Jun 2024) from **£22.48** to **£22.22**. During the last trading day the ETF fluctuated **1.84%** from a day low at **£22.22** to a day high of **£22.63**. The price has been going up and down for this period, and there has been a **-3.81%** loss for the last 2 weeks. Volume fell on the last day along with the ETF, which is actually a good sign as volume should follow the ETF. On the last day, the trading volume fell by **-2 thousand** shares and in total, **2 thousand** shares were bought and sold for approximately **£34.24** thousand.

The ETF lies in the middle of a wide and falling trend in the short term and further fall within the trend is signaled. Given the current short-term trend, the ETF is expected to fall **-12.38%** during the next 3 months and, with a 90% probability hold a price between **£18.76** and **£21.05** at the end of this 3-month period. Do note, that if the stock price manages to stay at current levels or higher, our prediction target will start to change positively over the next few days as the conditions for the current predictions will be broken.

A buy signal was issued from a pivot bottom point on **Wednesday, June 19, 2024**, and so far it has risen 2.69%. Further rise is indicated until a new top pivot has been found. Some negative signals were issued as well, and these may have some influence on the near short-term development. The **Ishares Msci Brazil Ucits Etf Usd (dist)** ETF holds a buy signal from the short-term Moving Average; at the same time, however, the long-term average holds a general sell signal. Since the long-term average is above the short-term average there is a general sell signal in the ETF giving a more negative forecast for the stock. On further gains, the ETF will meet resistance from the long-term Moving Average at **£23.82**. On a fall, the ETF will find some support from the short-term average at **£21.96**. A break-up through the long-term average will give another buy signal, while a fall below the short-term average will add another sell signal and strengthen the general signal. Furthermore, there is currently a sell signal from the 3 month Moving Average Convergence Divergence (MACD). Volume fell along with the price during the last trading day which is technical positive. One should, however, note that this ETF may have low liquidity in periods, which increases the general risk. The very low volume increases the risk and reduces the other technical signals issued.

Ishares Msci Brazil Ucits Etf Usd (dist) finds support from accumulated volume at **£22.13** and this level may hold a buying opportunity as an upwards reaction can be expected when the support is being tested. On the upside the ETF meets some resistance from accumulated volume at **£24.46**, **£24.54** and **£25.15**.

This ETF has average movements during the day, but be aware of low or falling volume as this increases the risk. During the last day, the ETF moved **£0.409** between high and low, or **1.84%**. For the last week the ETF has had daily average volatility of **1.28%**.

Ishares Msci Brazil Ucits Etf Usd (dist) holds several negative signals and we believe that it will still perform weakly in the next couple of days or weeks. We, therefore, hold a negative evaluation of this ETF.

Risk: **Medium**

Evaluation: **Sell Candidate**
