Tech commentaries:

The **Legg Mason International Low Volatility** ETF price gained **0.260%** on the last trading day (Friday, 17th May 2024), rising from **\$30.73** to **\$30.81**. It has now gained 10 days in a row. It is not often that ETFs manage to gain so many days in a row, and falls for a day or two should be expected. During the last trading day the ETF fluctuated **0.555%** from a day low at **\$30.65** to a day high of **\$30.82**. The price has risen in 10 of the last 10 days and is up by **3.84%** over the past 2 weeks. Volume has increased on the last day along with the price, which is a positive technical sign, and, in total, **125 thousand** more shares were traded than the day before. In total, **297 thousand** shares were bought and sold for approximately **\$9.15 million**.

The ETF lies in the upper part of a narrow and weak rising trend in the short term, and this may normally pose a very good selling opportunity for the short-term trader as reaction back towards the lower part of the trend can be expected. A break-up at the top trend line at **\$30.84** will firstly indicate a stronger rate of rising. Given the current short-term trend, the ETF is expected to rise **5.90%** during the next 3 months and, with a 90% probability hold a price between **\$31.42** and **\$32.66** at the end of this 3-month period.

The **Legg Mason International Low Volatility** ETF holds buy signals from both short and long-term Moving Averages giving a positive forecast for the stock. Also, there is a general buy signal from the relation between the two signals where the short-term average is above the long-term average. On corrections down, there will be some support from the lines at **\$30.58** and **\$29.77**. A breakdown below any of these levels will issue sell signals. A buy signal was issued from a pivot bottom point on **Tuesday, April 16, 2024**, and so far it has risen 6.13%. Further rise is indicated until a new top pivot has been found. Furthermore, there is a buy signal from the 3 month Moving Average Convergence Divergence (MACD). Volume is rising along with the price. This is considered to be a good technical signal.

Legg Mason International Low Volatility finds support from accumulated volume at \$29.84 and this level may hold a buying opportunity as an upwards reaction can be expected when the support is being tested. There is no resistance from accumulated volume above today's level and given the right condition the ETF may perform very well during the next couple of days.

In general the ETF tends to have very controlled movements and with good liquidity the risk is considered very low in this stock. During the last day, the ETF moved **\$0.170** between high and low, or **0.555%**. For the last week the ETF has had daily average volatility of **0.479%**.

Legg Mason International Low Volatility holds several positive signals, but we still don't find these to be enough for a buy candidate. At the current level, it should be considered as a hold candidate (hold or accumulate) in this position whilst awaiting further development.

Risk: Low

Evaluation: Hold/Accumulate
