Tech commentaries:

The **Invesco Us Treasury Bond 0-1 Year Ucits** ETF price fell by **-0.0713%** on the last day (Friday, 28th Jun 2024) from **37.87€** to **37.84€**. During the last trading day the ETF fluctuated **0.164%** from a day low at **37.84€** to a day high of **37.90€**. The price has fallen in 6 of the last 10 days but is still up by **0.04%** over the past 2 weeks. Volume fell on the last day along with the ETF, which is actually a good sign as volume should follow the ETF. On the last day, the trading volume fell by **-823** shares and in total, **12** shares were bought and sold for approximately **454.09€**.

The ETF is moving within a narrow and horizontal trend and further movements within this trend can be expected. Given the current horizontal trend, you can expect **Invesco Us Treasury Bond 0-1 Year Ucits** ETF with a 90% probability to be traded between **37.41€** and **38.10€** at the end of this 3-month period. A break of a horizontal trend is often followed by a large increase in the volume, and ETFs seldom manage to go directly from the bottom of a trend up to the top. ETFs turning up in the middle of a horizontal trend are therefore considered to be potential runners.

The **Invesco Us Treasury Bond 0-1 Year Ucits** ETF holds a sell signal from the short-term Moving Average; at the same time, however, there is a buy signal from the long-term average. Since the short-term average is above the long-term average there is a general buy signal in the ETF giving a positive forecast for the stock. On further gains, the ETF will meet resistance from the short-term Moving Average at approximately **37.85€**. On a fall, the ETF will find some support from the long-term average at approximately **37.72€**. A break-up through the short-term average will send a buy signal, whereas a breakdown through the long-term average will send a sell signal. A buy signal was issued from a pivot bottom point on **Thursday, June 13, 2024**, and so far it has risen **0.689%**. Further rise is indicated until a new top pivot has been found. Some negative signals were issued as well, and these may have some influence on the near short-term development. Furthermore, there is currently a sell signal from the 3 month Moving Average Convergence Divergence (MACD). Volume fell along with the price during the last trading day which is technical positive. One should, however, note that this ETF may have low liquidity in periods, which increases the general risk. The very low volume increases the risk and reduces the other technical signals issued.

Invesco Us Treasury Bond 0-1 Year Ucits finds support from accumulated volume at **37.69€** and this level may hold a buying opportunity as an upwards reaction can be expected when the support is being tested. On the upside the ETF meets some resistance just above today's level from accumulated volume at **37.91€**, **37.95€** and **37.99€**.

In general the ETF tends to have very controlled movements and therefore the general risk is considered very low. However, be aware of low or falling volume and make sure to keep an eye on the ETF. During the last day, the ETF moved **0.0620€** between high and low, or **0.164%**. For the last week the ETF has had daily average volatility of **0.200%**.

Several short-term signals are positive and we conclude that the current level may hold a buying opportunity, as there is a fair chance for **Invesco Us Treasury Bond 0-1 Year Ucits** ETF to perform well in the short-term period. We have upgraded our analysis conclusion for this ETF since the last evaluation from a Hold/Accumulate to a Buy candidate.

Risk: Low
