MACD:	Sell

Tech commentaries:

The **BMO Premium Yield** ETF price fell by **-0.84%** on the last day (Thursday, 30th May 2024) from **\$31.05** to **\$30.79**. During the last trading day the ETF fluctuated **0.390%** from a day low at **\$30.78** to a day high of **\$30.90**. The price has been going up and down for this period, and there has been a **-1.41%** loss for the last 2 weeks. Volume has increased on the last day by **5 thousand** shares but on falling prices. This may be an early warning and the risk will be increased slightly over the next couple of days. In total, **6 thousand** shares were bought and sold for approximately **\$172.52** thousand.

The ETF is at the lower part of a narrow and horizontal trend in the short term, and normally this may pose a good buying opportunity, though a breakdown through the bottom trend line at **\$30.70** will give a strong sell signal and a trend shift may be expected. Given the current horizontal trend, you can expect **BMO Premium Yield** ETF with a 90% probability to be traded between **\$30.99** and **\$31.68** at the end of this 3-month period. A break of a horizontal trend is often followed by a large increase in the volume, and ETFS seldom manage to go directly from the bottom of a trend up to the top. ETFS turning up in the middle of a horizontal trend are therefore considered to be potential runners.

There are few to no technical positive signals at the moment. The **BMO Premium Yield** ETF holds sell signals from both short and long-term Moving Averages giving a more negative forecast for the stock. On corrections up, there will be some resistance from the lines at **\$31.12** and **\$30.94**. A break-up above any of these levels will issue buy signals. A sell signal was issued from a pivot top point on **Wednesday, May 22, 2024**, and so far it has fallen **-1.82%**. Further fall is indicated until a new bottom pivot has been found. Furthermore, there is currently a sell signal from the 3 month Moving Average Convergence Divergence (MACD). **BMO Premium Yield** gained volume on the last day, but on falling prices. In technical terms, this is called divergence and may be an early warning. In some cases, increasing volume on falling prices may be considered positive, but that is mainly in typical "sell-offs".

BMO Premium Yield finds support from accumulated volume at **\$30.66** and this level may hold a buying opportunity as an upwards reaction can be expected when the support is being tested. On the upside the ETF meets some resistance just above today's level from accumulated volume at **\$30.80**, **\$30.90** and **\$30.97**.

In general the ETF tends to have very controlled movements and with good liquidity the risk is considered very low in this stock. During the last day, the ETF moved **\$0.120** between high and low, or **0.390%**. For the last week the ETF has had daily average volatility of **0.343%**.

BMO Premium Yield holds several negative signals and is within a narrow and falling trend, so we believe it will still perform weakly in the next couple of days or weeks. We therefore hold a negative evaluation of this ETF. Due to some small weaknesses in the technical picture we have downgraded our analysis conclusion for this ETF since the last evaluation from a Hold/Accumulate to a Sell candidate.

Risk: **Low**

Evaluation: **Sell Candidate**
